Catalog Article - Debug Gloo

By Henrique Santos (Deactivated) 1 min 20 Add a reaction

Summary

As described in https://docs.solo.io/gloo-edge/main/operations/debugging_gloo/, to troubleshoot an abnormal or unexpected behavior from Gloo, it is possible to fetch many configurations that are being used by the Gloo components.

As such, it is needed to do a port-forward to a gateway-proxy and retrieve via cURL the configurations that it has in memory. https://www.envoyproxy.io/docs/envoy/latest/operations/admin describes all the actions possible.

General Information

Change Type	Normal
Change Risk	Low
Downtime Involved	No
Rollback Available	N/A, as there is no introduced change.
Implementation Team	Global Routing and Security and SRE
Component/Asset(s)	Gloo

Implementation Plan

NOTE: Always re-check https://docs.solo.io/gloo-edge/main/operations debugging_gloo/ to validate that the procedure hasn't changed.

1. Access the cluster;
2. Check the current `gateway-proxy` pods and choose one or the one that needs to be troubleshooted:

```
kubectl get pods -l gloo=gateway-proxy -n kube-gloo-system
```

3. Port forward to port 19000 on that specific pod:

```
kubectl -n kube-gloo-system port-forward gateway-proxy-[FILL]
```

4. On another terminal with the same Kubernetes context, run the followin commands in order to save the needed dumps:

```
curl -X GET 127.0.0.1:19000/config_dump?include_eds > config_d
curl -X GET 127.0.0.1:19000/clusters > clusters.json
curl -X GET 127.0.0.1:19000/stats > stats.json
```

   If more configurations are needed, check https://www.envoyproxy.io/docs/envoy/latest/operations/admin.

5. Go back to the original terminal and do Ctrl+C to cancel the port-forward.

Testing and Validation Plan

1. Validate if the fetched configs are not empty.

Rollback Plan

Not applicable since this shouldn't introduce any change, as it's a port forward command and doing GET commands to an admin endpoint.
