ICE | NATS2CRD: Reloading odc-operators Helm Values

By Alex Lin (Deactivated) 1 min 27 Add a reaction

[Problem Description] [Troubleshooting] [Mitigation]

Area	ICE, K8s Clusters
Error Code	N/A
Service	Stamp
JIRA Issue(s)	N/A

💥 Problem Description

A Helm release that is controlled by the `os-<service>-controller-manager` deployment within the `odc-operators` namespace is not loading the correct values. This has been found while creating the data platform clusters since they've moved the configmap creation for NATS2CRD from the TF to their flux stack. NATS2CRD currently looks for the configmap (previously guaranteed to exist from the TF) and uses default values if not found.

🧯 Troubleshooting

Step instructions

1.

🛠️ Mitigation

1. In the affected cluster, list the secrets in the affected service's namespace:
   a.
   ```
   kubectl get secret -n nats2crd-ga
   ```

a.
```
kubectl delete secret sh.helm.release.v1.outsystems-nats2crd-servic
```

3. After the deletion of these secrets, the controller-manager deployment for the affected service will need to be restarted:

a.
```
kubectl get deployment -n odc-operators

Take note of the deployment that contains the affected service: os-
```

b.
```
kubectl rollout restart deployment os-<service>-controller-manager
```

4. Verify that the affected service is restarted with the correct values:

a.
```
kubectl get secret -n nats2crd-ga

Take note of the secret(s) for the next step with name similar to:
```

b.
```
kubectl get secrets sh.helm.release.v1.outsystems-nats2crd-service.
```
