Description

In anticipation of a significant increase in usage volume during and after One Conference, we have implemented a strategic scaling plan for our AWS Trial AI Models used as part of Agent Workbench. To accommodate the expected higher throughput in terms of Transactions Per Minute (TPM) and Requests Per Minute (RPM), we have established multiple AWS accounts specifically dedicated to AWS Bedrock services. This multi-account architecture is designed to enhance our scalability and manageability. By distributing the load across several AWS accounts, we can more effectively handle the increased demand without compromising performance or reliability.\ Additionally, these new accounts will segregate the environments used for positive and negative testing rings. The positive ring will handle standard, high-performing models, while the negative ring will be used for testing edge cases, failures, and other non-standard scenarios. This approach not only improves our ability to scale but also enhances our operational oversight, allowing us to maintain high standards of service quality for our customers.
For that, we need new parameters with the keys in the SRE Managed Account (Standard for Static Keys)
